PixelPerfect

Screenshot API

Reset Password

User Guide & Process Documentation

Prepared by	OneTechly
Product	PixelPerfect Screenshot API
Date	April 2026
Version	1.0.0
URL	pixelperfectapi.net

This guide explains the complete password reset process for PixelPerfect Screenshot API users — from the login error that triggers the flow, through receiving the reset email, setting a new password, and successfully signing back in.

Overview

The PixelPerfect Reset Password flow consists of **8 steps** that guide a user from a failed login attempt through to full account recovery. The process uses Gmail SMTP to deliver a secure, time-limited reset link directly to the user's registered email address. Reset links expire after **1 hour** for security.

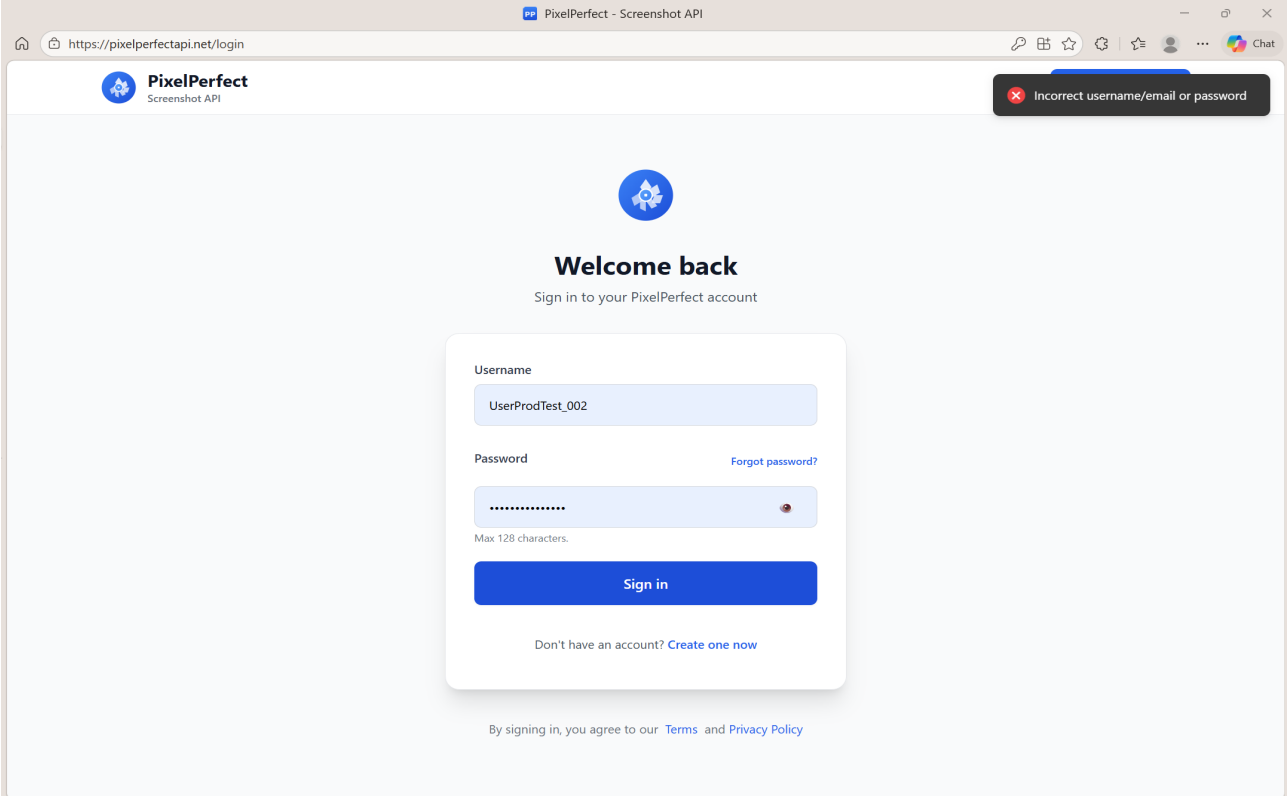
Step	Action	Location
1	Attempt login — error toast displayed	pixelperfectapi.net/login
2	Click 'Forgot password?' → enter email address	pixelperfectapi.net/forgot-password
3	Receive 'Reset Password' confirmation screen	pixelperfectapi.net/forgot-password
4	Open inbox — reset email has arrived	User's Gmail / email client
5	Open email — click Reset Password button	User's Gmail / email client
6	Set a new password on the reset form	pixelperfectapi.net/reset?token=…
7	Return to login — sign in with new password	pixelperfectapi.net/login
8	Access dashboard — account fully recovered	pixelperfectapi.net/dashboard

Step-by-Step Process

1 Login Attempt Fails

The user navigates to **pixelperfectapi.net/login** and enters their username and password. If the password is incorrect (e.g. after an account password change), the app displays an error toast: *'Incorrect username/email or password.'* This is the trigger to begin the password reset flow.

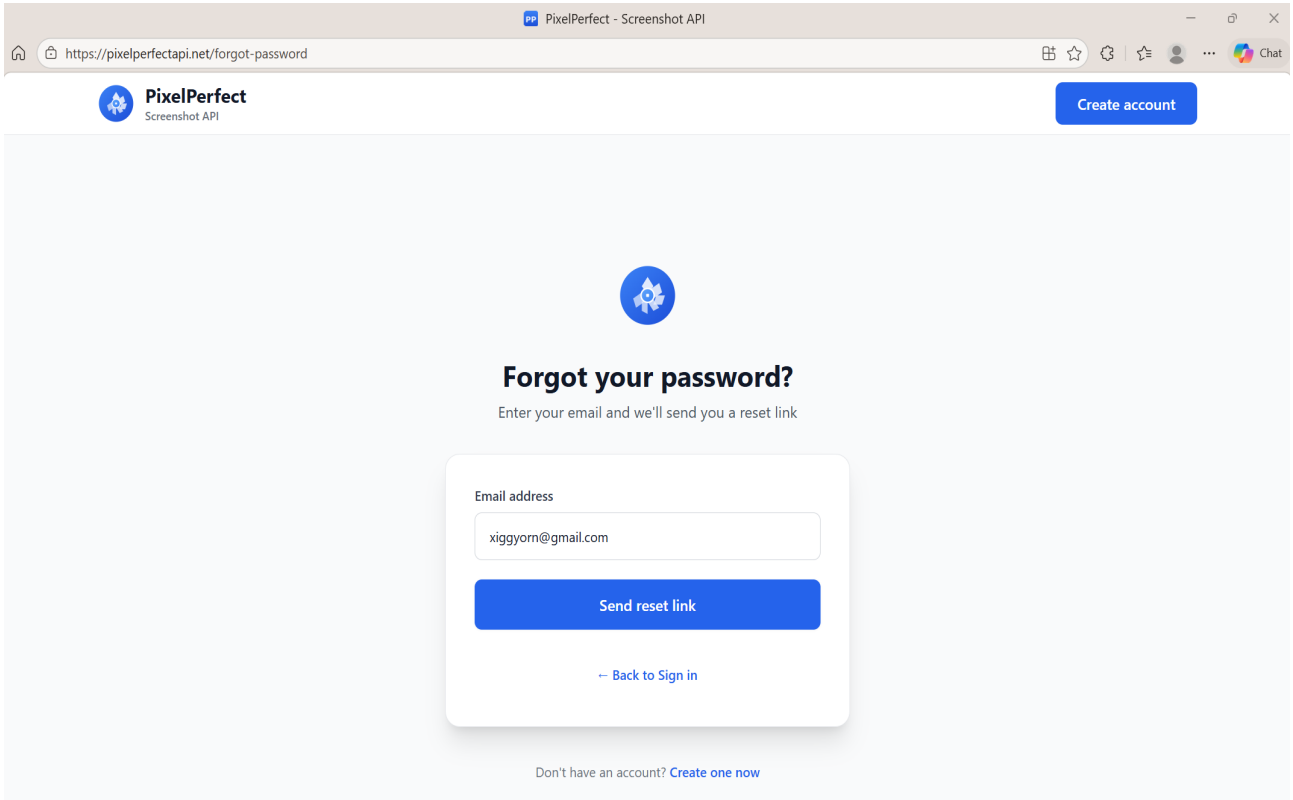
Tip: The login form validates inputs before submission. The error appears as a dismissible notification in the top-right corner.



Screenshot 1 — Login error toast indicating incorrect credentials

2 Navigate to Forgot Password

The user clicks the **'Forgot password?'** link displayed inline next to the Password label on the login form. This navigates to **pixelperfectapi.net/forgot-password** where they enter their registered email address (e.g. xiggyorn@gmail.com) and click **'Send reset link.'**

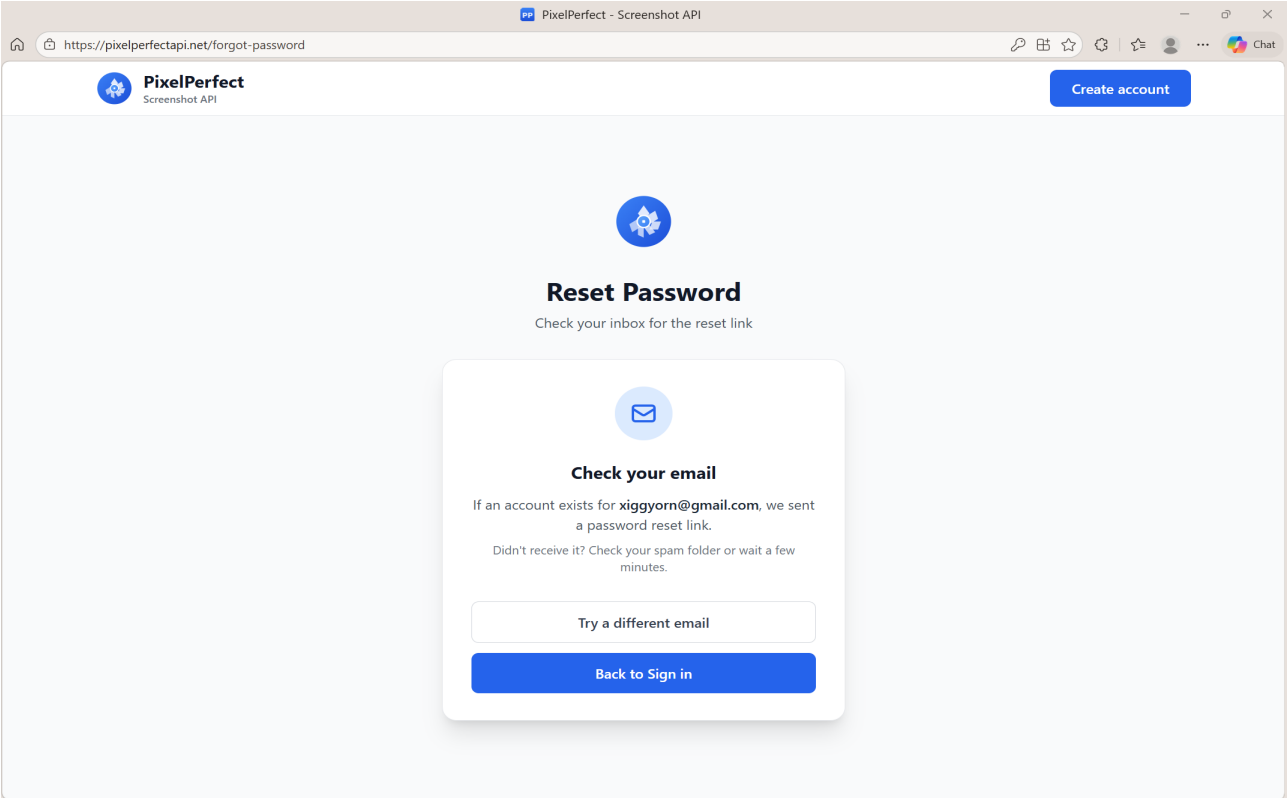


Screenshot 2 — Forgot Password form with email entered and 'Send reset link' button

3 Confirmation Screen Displayed

After submitting the email, the page transitions to a success screen titled **'Reset Password'**. It confirms that if an account exists for the provided email, a reset link has been sent. This design intentionally never reveals whether the email is registered — a standard security best practice (user enumeration protection).

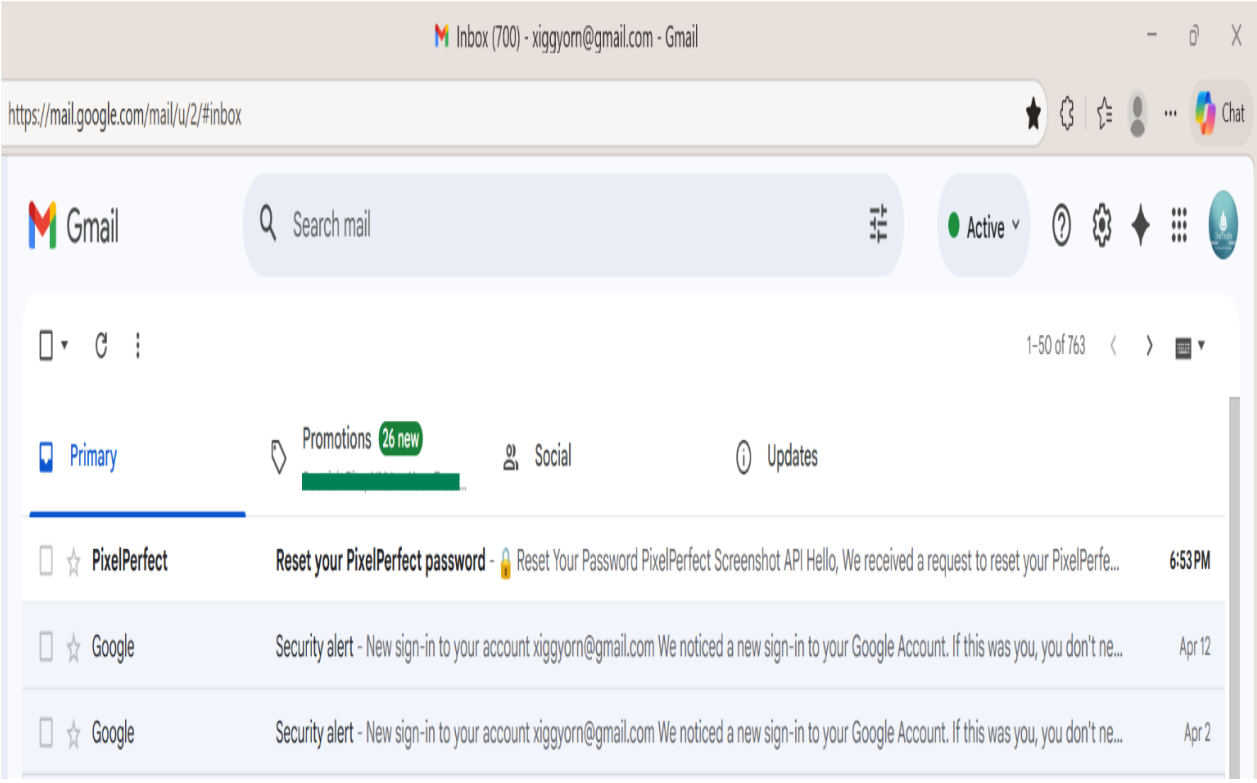
Tip: If the email does not arrive within 2 minutes, check the spam/junk folder. The sender address is onetechly@gmail.com.



Screenshot 3 — Reset Password confirmation screen after email submission

4 Reset Email Arrives in Inbox

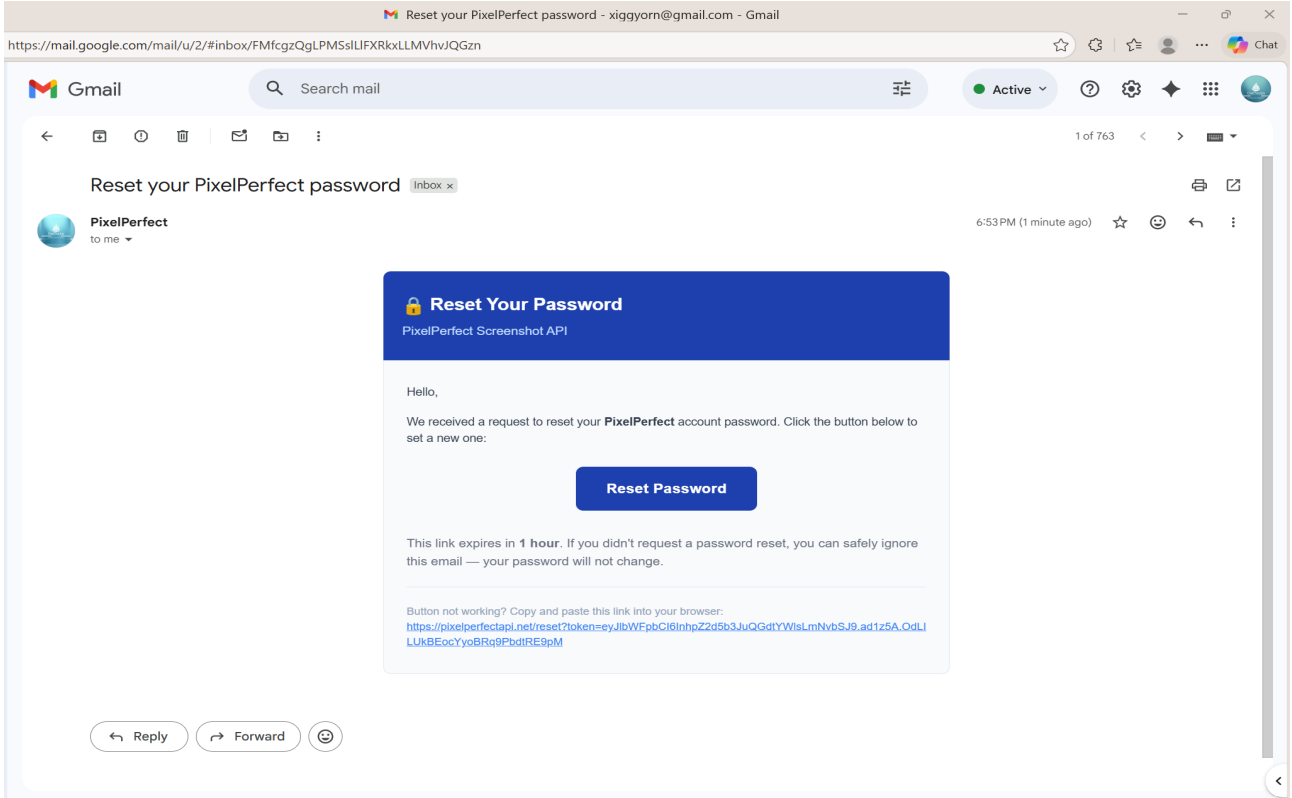
The user opens their Gmail (or other email client) inbox. A new email from **PixelPerfect** with the subject line **'Reset your PixelPerfect password'** appears at the top of the Primary tab. The email is delivered within seconds via Gmail SMTP over TLS (port 587, STARTTLS).



Screenshot 4 — Inbox showing the PixelPerfect reset email at the top

5 Open the Reset Email

Inside the email the user sees a professionally branded message from PixelPerfect Screenshot API containing a prominent **'Reset Password'** button. The email includes a plain-text fallback URL for clients that block HTML. The link expires in **1 hour** for security.

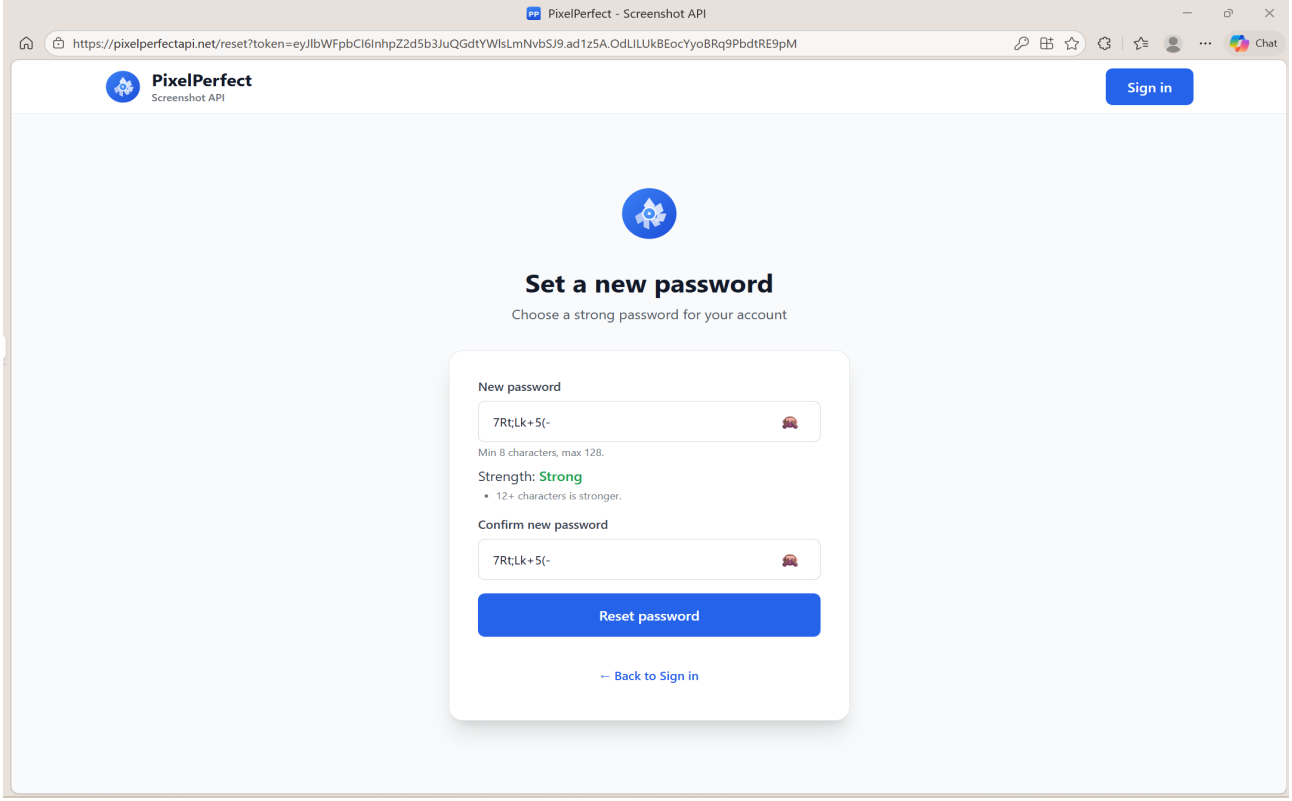


Screenshot 5 — Reset email content with Reset Password button and fallback link

6 Set a New Password

Clicking **Reset Password** opens **pixelperfectapi.net/reset?token=…** — a secure page that reads the one-time token from the URL. The user enters a new password and confirms it. A live **password strength indicator** (Weak / Medium / Strong) provides real-time feedback. The form validates that both fields match before submitting.

Tip: Use at least 8 characters. A mix of uppercase, lowercase, numbers, and symbols is rated Strong.



Screenshot 6 — Set a new password form with strength indicator showing 'Strong'

7 Sign in with New Password

After the password is reset, the app automatically redirects the user to the login page with a success toast. The user enters their username and the new password, then clicks **Sign in**.

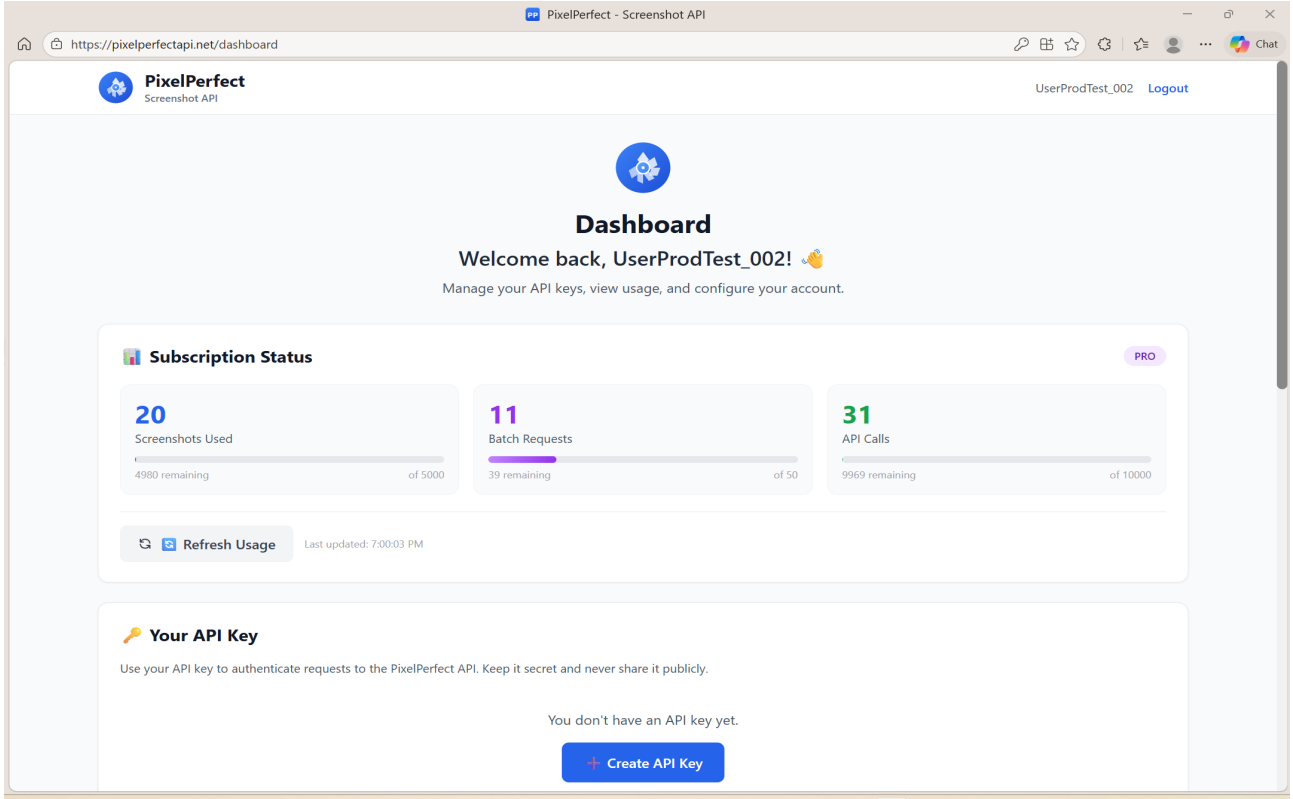
■ Account Successfully Recovered



Screenshot 8 — Dashboard loaded successfully after password reset

What the dashboard confirms:

After a successful reset and login the dashboard shows:

- **Username** and **Logout** button confirming authentication.
- **Subscription Status** (PRO tier) with accurate usage counters.
- **API Key** section available for key management.

All user data, subscription details, and screenshot history are fully preserved — the reset process only changes the password.

Security Notes

Token expiry	Reset links are valid for **1 hour**. After expiry the link returns an 'expired' error and the user must request a new one.
One-time use	Each token is single-use. Once the password is reset the link is invalidated and cannot be reused.
User enumeration protection	The confirmation screen always shows 'If an account exists…' — it never confirms or denies whether the email is registered.
Secure transmission	Reset links are sent via Gmail SMTP on port 587 with STARTTLS. All frontend-to-backend traffic uses HTTPS.
Data preservation	The reset flow only updates the hashed password. All user data, subscriptions, screenshot history, and API keys remain untouched.
